

# Project Status Report

## Overview

This document demonstrates the **mdpdf** converter, which transforms Markdown files into beautifully typeset PDFs using the *Typst* typesetting engine.

The primary use case is converting Markdown files generated by Claude into clean, professional documents suitable for sharing with colleagues and clients.

## Key Features

### Typography

The converter uses **Inter** for body text — a modern, highly legible typeface designed for computer screens that also works beautifully in print. Code blocks use **JetBrains Mono**, a developer-focused monospace font.

All text is properly justified with Knuth-Plass line breaking, the same algorithm used by TeX and LaTeX. This means paragraphs have even spacing and professional-looking margins on both sides.

### Code Support

Here's an example of syntax-highlighted code:

```
fn fibonacci(n: u64) → u64 {  
    match n {  
        0 => 0,  
        1 => 1,  
        _ => fibonacci(n - 1) + fibonacci(n - 2),  
    }  
}  
  
fn main() {  
    for i in 0..10 {  
        println!("fib({}) = {}", i, fibonacci(i));  
    }  
}
```

Inline code like `Vec<String>` and `HashMap<K, V>` renders with a subtle background.

## Lists

Unordered lists:

- First item with some longer text to demonstrate how list items wrap across multiple lines when the content exceeds the available width
- Second item
- Third item
  - Nested item A
  - Nested item B
    - Deeply nested

Ordered lists:

1. Design the architecture
2. Implement the parser
3. Build the PDF renderer
4. Test with real documents
5. Ship it

## Task Lists

- ☒ Set up Rust project
- ☒ Implement Markdown parser
- ☒ Implement Typst backend
- ☐ Add image support
- ☐ Publish to crates.io

## Block Quotes

Good design is as little design as possible. Less, but better — because it concentrates on the essential aspects, and the products are not burdened with non-essentials.  
— Dieter Rams

## Tables

| Feature       | Status   | Priority |
|---------------|----------|----------|
| Headings      | Complete | High     |
| Bold & Italic | Complete | High     |
| Code blocks   | Complete | High     |
| Tables        | Complete | Medium   |

| Feature    | Status   | Priority |
|------------|----------|----------|
| Task lists | Complete | Medium   |
| Images     | Planned  | Low      |

---

## Conclusion

The **mdpdf** tool provides a simple, fast way to convert Markdown to high-quality PDFs. It combines the convenience of Markdown with the typographic excellence of Typst, resulting in documents that look polished and professional.

*Built with Rust for speed and reliability.*
